Preface

This is the ninth annual report providing the results of the BRANZ Non-Residential Survey. BRANZ surveys builders and designers of non-residential buildings on the physical characteristics of the building. The purpose is to obtain data on non-residential buildings that is not available from official sources. This data includes what type of materials are used. The data is useful for studies in the fields of sustainability, energy efficiency, durability and engineering.

Acknowledgements

This work was funded by the Building Research Levy. We would like to thank all of the builders and designers who filled in the survey form and returned it to BRANZ.

Physical characteristics of new non-residential buildings 2023

BRANZ Study Report SR500

Abstract

Official data on the characteristics of non-residential buildings is limited. Building consent data held by Statistics New Zealand gives numbers by building type, value and floor area, aggregated into territorial authorities and regions. However, there is no data on materials used.

BRANZ began surveying builders and designers in 1998 to obtain data on materials used. We have since compiled a database of approximately 400 non-residential buildings per year containing information on the materials used by building component.

This report contains the results of these surveys on the materials used in new non-residential buildings. The aim is to provide information useful to building material manufacturers, retailers/wholesalers, builders, designers, researchers, and government officials.

Keywords

Materials, building envelope, claddings, floors, framing, insulation.

1. Introduction

BRANZ surveys about 2,000 non-residential buildings per year in the BRANZ Non-Residential Survey. The survey also collects a variety of data on materials used in new and altered residential buildings.

The survey is a postal survey to the builder or designer identified on the building consent application form, and the questions relate to each individual consent. Generally, 400 returns are received each year. An incentive is offered (a Lotto ticket or book voucher) for the return of each survey form.

The consent information is obtained from the Whats On[1] building consent data. BRANZ uses this to determine a sample of non-residential buildings for each period from 31 territorial authorities. The territorial authorities surveyed are:

Auckland	Christchurch	Dunedin	Franklin
Far North	Gisborne	Hutt City	Hamilton
Invercargill	Kapiti	Manukau	Marlborough
Napier	New Plymouth	North Shore	Porirua
Palmerston North	Queenstown	Rodney	Southland
Tauranga	Thames-Coromandel	Tasman	Waikato
Waipa	Wellington	Western Bay of Plenty	Whangarei
Waitakere			

The survey form is constantly evolving to include new questions as required. However, it is important for BRANZ to keep the survey form as simple, concise and clear as possible. Therefore, BRANZ keeps the survey form to a single page.

BRANZ weights the responses by the share of building activity for each building type in the calculation of the market share. This prevents some building types (such as farm buildings) from having a disproportionate share of the total market share should BRANZ receive a larger number of survey returns of one building type.

Using the data collected, representative estimates of the incidence and proportions of many different materials can be made. The components analysed are:

- roof claddings
- wall claddings
- main structure
- partition wall framing
- wall infill framing
- wall insulation
- ceiling insulation
- floor insulation.

[1] *Whats-On report (Monthly).* BCI New Zealand, Auckland, New Zealand.

A limitation of the survey is that it does not ask why certain materials are selected. This means that the report contains no commentary on why material trends might be changing.

The value of new non-residential consents is presented in Figure 1 broken down into three different building types – institutional, commercial and industrial.

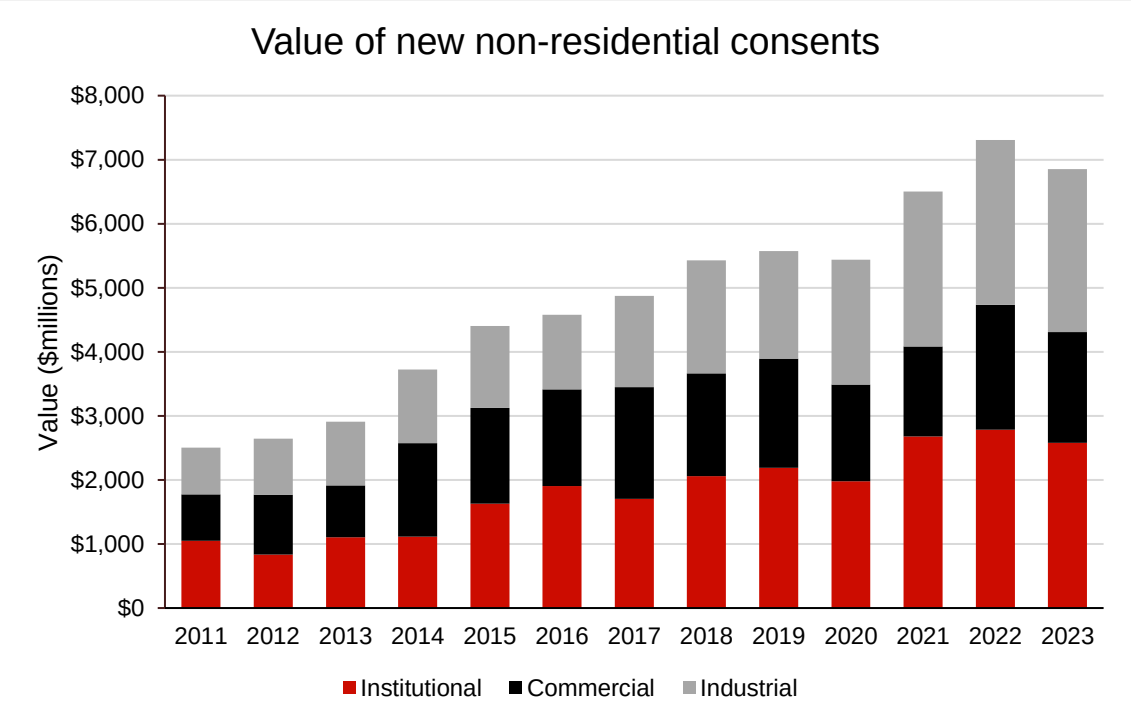

Figure 1. Value of new non-residential consents.

2. Summary

In general, many of the market shares of materials have been relatively steady over the years surveyed.

Sheet metal remains the most popular roof cladding material (Figure 2). Steel, aluminium and other metals continues to be the dominant wall cladding material due to their prominence in industrial and farm buildings (Figure 3). Concrete (mainly precast panels) tends to be variable but in 2023 made up a fifth of all new, non-residential wall cladding. Steel remains the primary material for structural framing (Figure 4).

Timber is the most common material for infill framing – the framing between the main structural elements (Figure 5). The market share of timber partition wall framing, along with 'other' partition wall framing options decreased slightly, meanwhile share of steel increased significantly (Figure 6). Meanwhile, the market share of 'other' partition wall framing options, which consists of insulated panels and glazing, dominates the market share of partition wall framing.

Fibreglass insulation and 'polyester and other' insulation types have an equal amount of the market share of both wall (Figure 7) and ceiling insulation (Figure 8). Polystyrene is still the most common insulation in insulated floors (Figure 9).

3. Main results

Key results are shown in the following charts. The data for these charts is in the tables in Appendix A.

Due to the variations in the mix of buildings year to year, market shares can be highly variable. Therefore, changes in share may be due to a change of building types rather than a change in preference for any particular building material.

3.1 Roof claddings

Sheet metal (76%) is still the predominant roof cladding material for new non-residential buildings (Figure 2).

The 'other' category increased slightly from 21% in 2022 to 24% in 2023. The 'other' category consists of membrane roofing, insulated panels and plastic film used on farm shelters.

Metal and concrete tiles are still relatively uncommon in non-residential buildings and do not feature in the 2023 results.

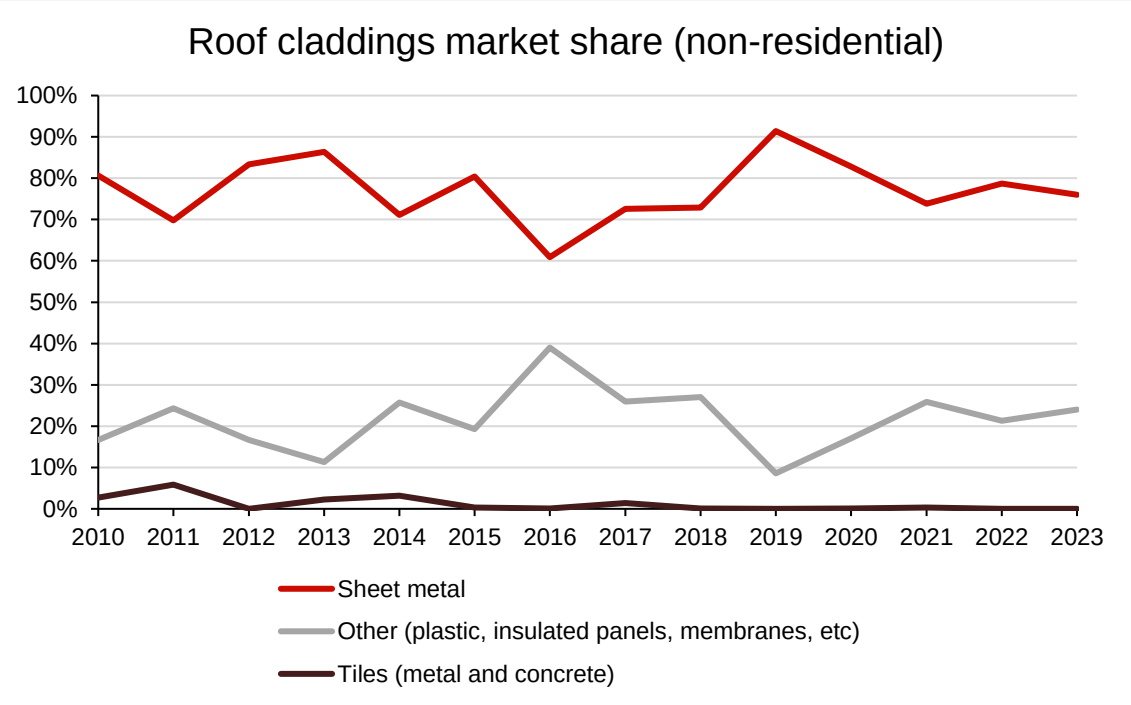

Figure 2. Roof claddings market share.

3.2 Wall claddings

Steel, aluminium and other metals (59%) are the dominant wall cladding materials due in large part to their overrepresentation in the construction of industrial and farm buildings (Figure 3).

Concrete (mainly precast panels) tends to be variable, but in 2023, the market share of concrete (21%) decreased slightly from the year prior (Figure 3). The 'other' category, which primarily consists of fibre-cement products, increased significantly, going from 8% in 2022 to 18% in 2023.

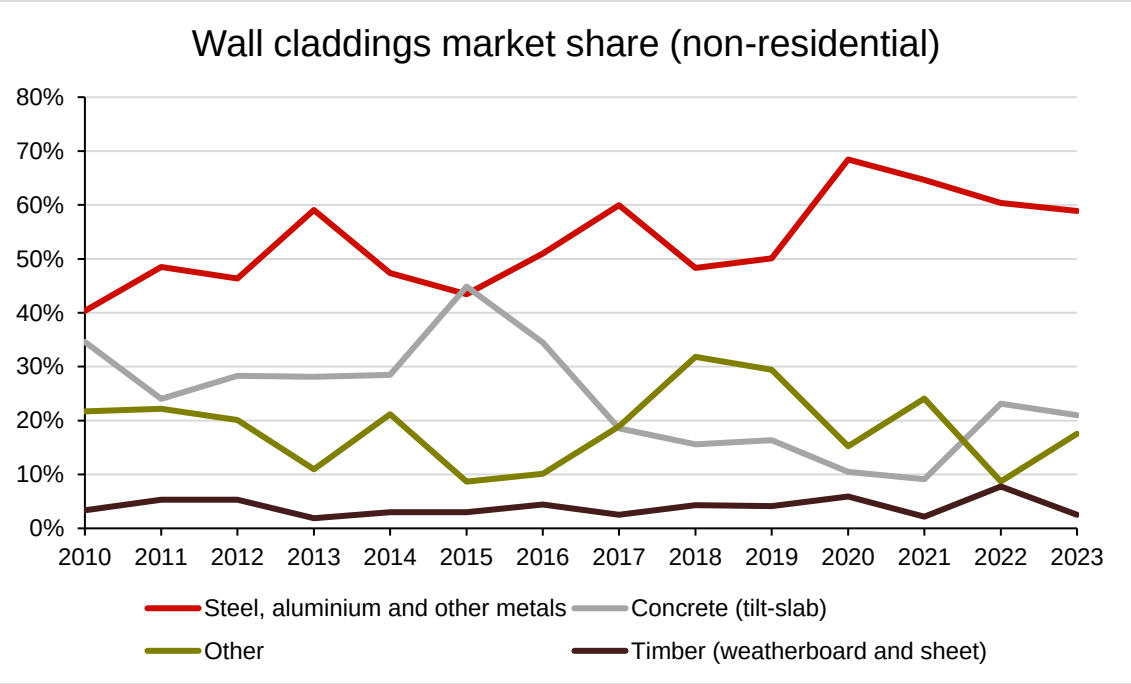

Figure 3. Wall claddings market share.

3.3 Main structure

Use of steel in main structural frames increased slightly, jumping from 51% in 2022 to 56% in 2023 (Figure 4). Meanwhile, the market share of timber framing (34%) decreased slightly.

The market share of concrete (8%) and 'other' (2%) largely remained the same as last year, with the former increasing slightly and the latter decreasing slightly.

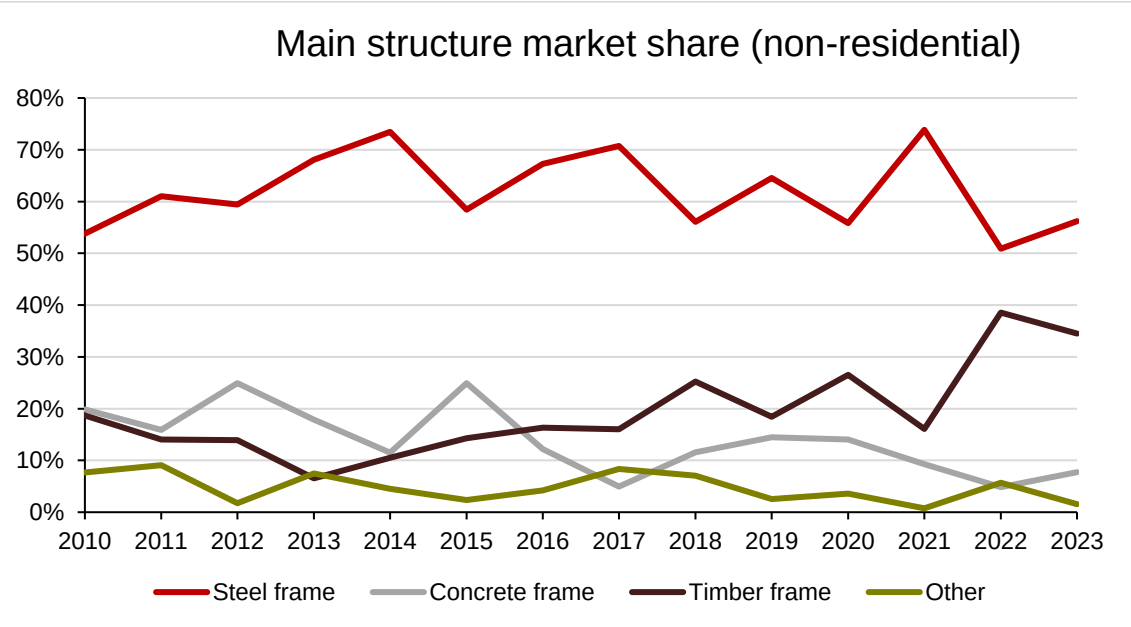

Figure 4. Main structure market share.

3.4 Wall infill framing

Wall infill framing is the framing between the main structural frames. The market share of timber well infill framing regained its position as the predominant material type, increasing to 45% in 2023 versus 38% the year prior. The market share of steel decreased to 42%, just below timber wall infill framing (Figure 5). The market share of concrete (4%) decreased in 2023, while the 'other' category (9%) remained largely the same as last year. The 'other' category primarily consists of glazing.

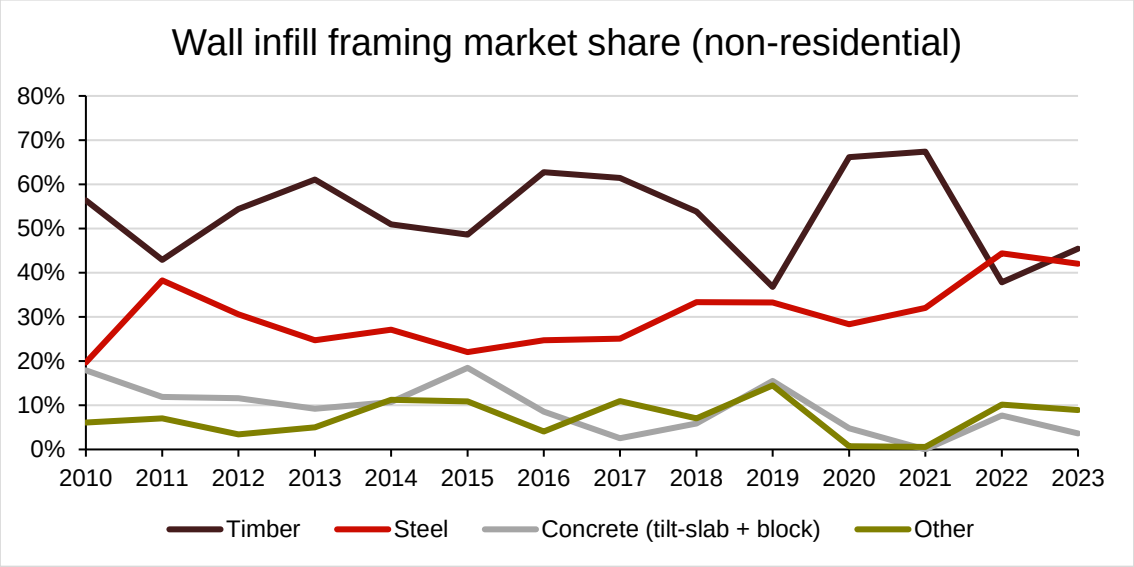

Figure 5. Wall infill framing market share.

3.5 Partition wall framing

The market share of both timber (29%) and 'other' (38%) partition wall framing options decreased slightly in 2023 (Figure 6). The 'other' category includes insulated panels and glazing. Meanwhile, the market share of steel partition wall framing increased significantly, jumping from 17% in 2022 to 29% in 2023 (Figure 6).

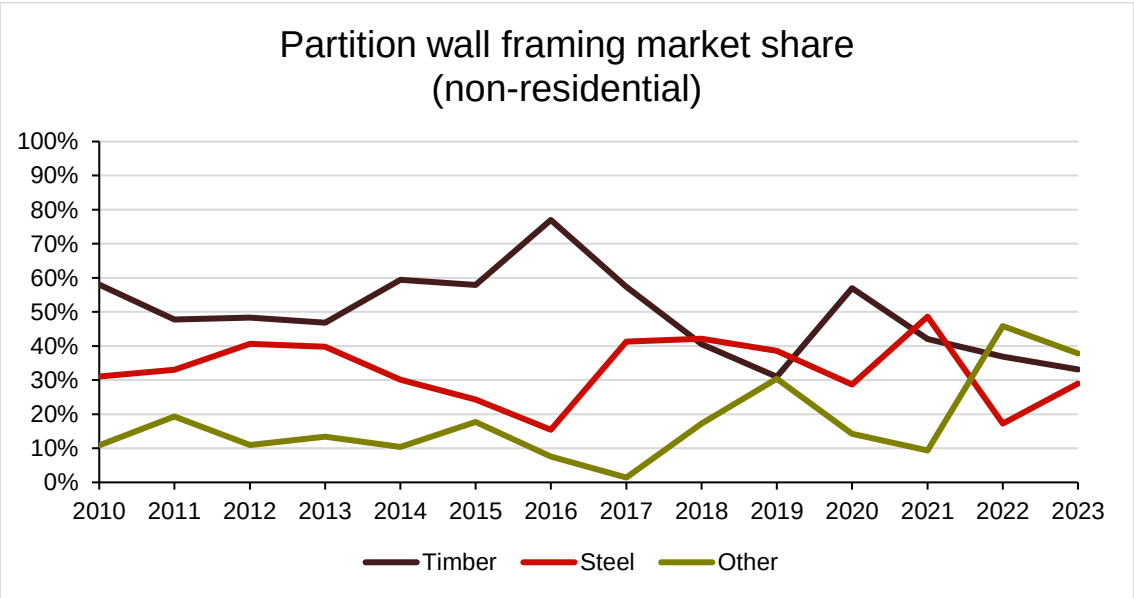

Figure 6. Partition wall framing market share.

3.6 Insulation

Wall insulation, ceiling insulation and floor insulation are dealt with separately in this section.

Farm buildings have not been included as it is uncommon for farm buildings to use insulation and they have a large share of the non-residential building market.

3.6.1 Wall insulation

The market share of fibreglass (52%) increased in 2023. Meanwhile, the share of 'polyester and other' category decreased to 48% (Figure 7).

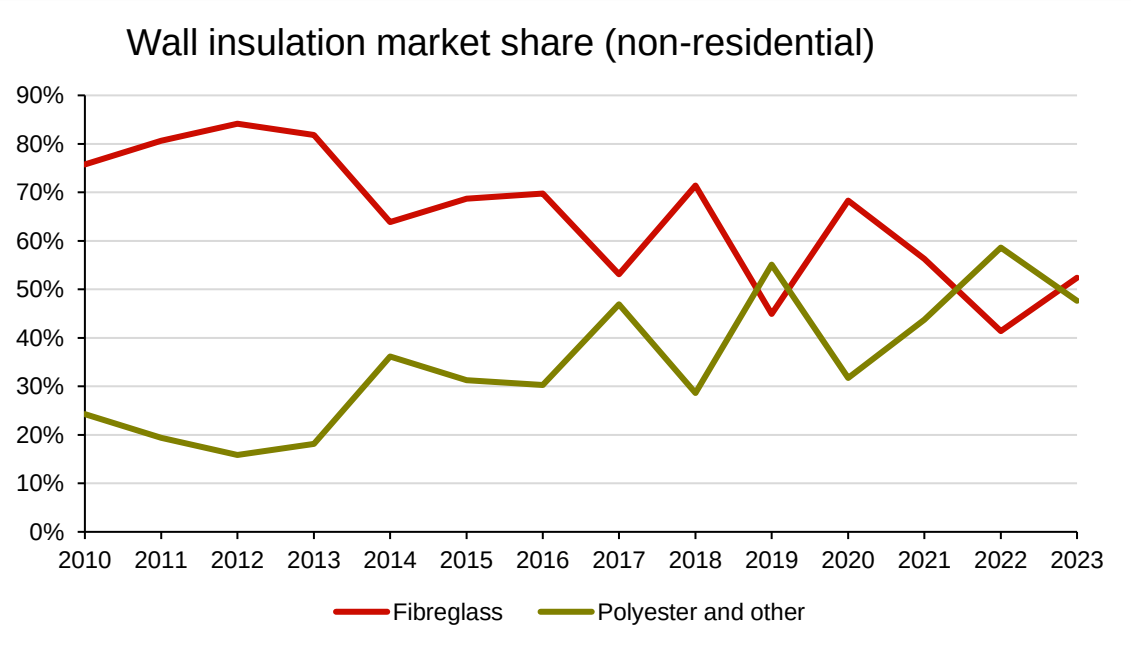

Figure 7. Wall insulation market share.

3.6.2 Ceiling insulation

Normally, most buildings use the same insulation material in the wall and ceiling, which means that market share in each market tends to follow the other.

Like with walls above, the market share of fibreglass (50%) increased while the market share of 'polyester and other' (50%) decreased (Figure 8).

'Other' primarily consists of polystyrene, which is common as part of insulated panels in industrial buildings.

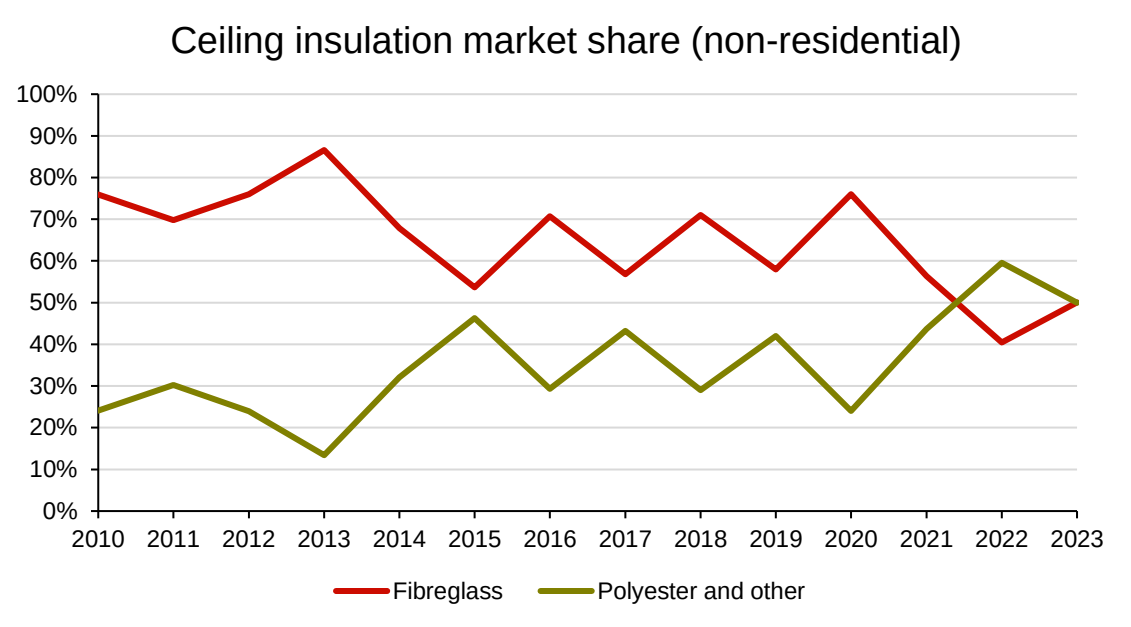

Figure 8. Ceiling insulation market share.

3.6.3 Floor insulation

For those buildings with floor insulation, sheet polystyrene is the still the most common floor insulation material (Figure 9).

Note that the question on insulation of concrete slabs was changed in 2015. This chart assumes that all buildings that selected underslab full/partial used sheet polystyrene, although non-polystyrene waffle pod systems have entered the market. Waffle pod has decreased from 26% in 2022 to 16% in 2023.

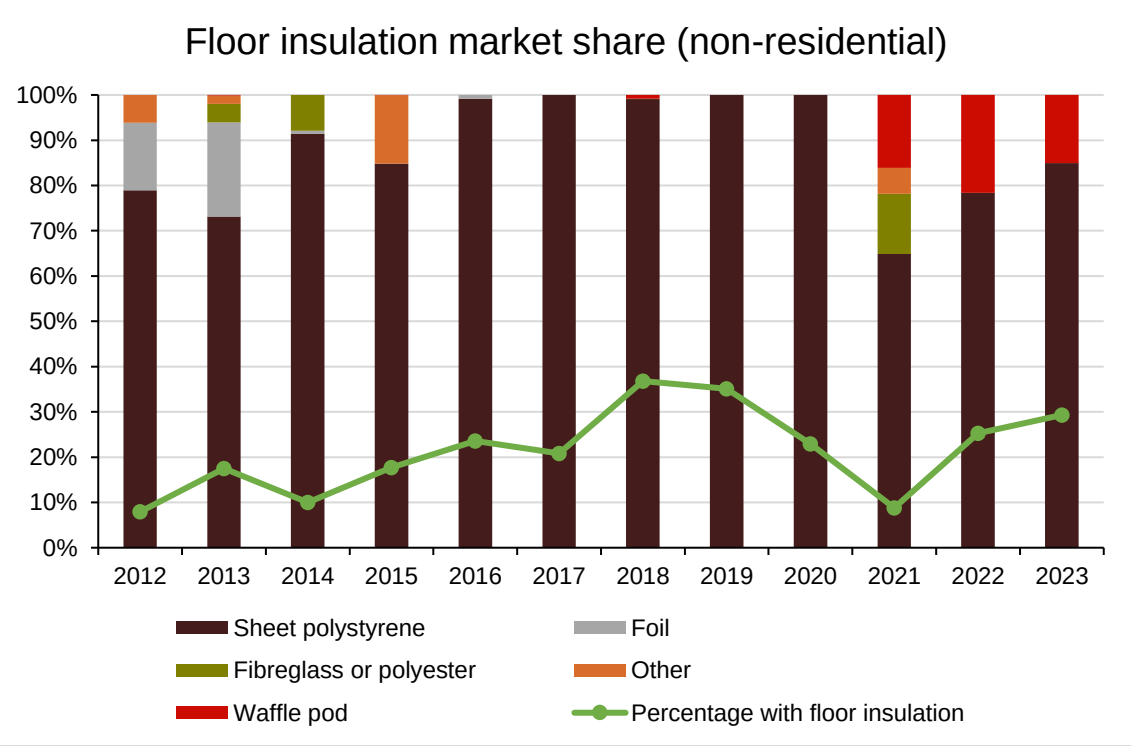

Figure 9. Floor insulation.
